

***Trirhithrum albomaculatum* (Röder)**

Ceratitis albo-maculata Röder, 1885: 136.

Wing length=(4.5-)5.0-5.1 mm; Aculeus length=1.48 mm.

Male

Head: Arista micropubescent. Two pairs frontal setae. Face white or pale yellow.

Thorax: Postpronotal lobe entirely dark. Scutum without silvery-white microtrichose areas. Scutellum disk white in basal third to two-thirds; apical dark area undivided. Anepisternum with a diagonal white stripe covering posterior half; with one seta. Anatergite without a bright silvery spot.

Wing: Pattern distinct. Subbasal and discal crossbands fused posterior to R_s , and cell c extensively hyaline; discal crossband distally aligned with a point within pterostigma and R-M crossvein aligned with edge of discal crossband. Subapical crossband joined to discal crossband; base deep, partly in cell dm. Posterior apical crossband reduced to a short spur. Anal lobe coloured, at most with an indistinct hyaline indentation or narrowly hyaline along margin. No bulla.

Legs: Femora dark.

Abdomen: With distinct silvery microtrichose bands on terga II and IV.

Female

Terminalia: Aculeus abruptly drawn into a point; spermatheca elongate.

(description after White et al., 2003)
