

***Trirhithrum albopleurale* White**

*Trirhithrum albopleurale* White, 2003: 84.

Wing length=4.9-5.0 mm.

Male

Head: Arista plumose. Two pairs frontal setae. Face white or pale yellow.

Thorax: Postpronotal lobe entirely dark. Scutum without silvery-white microtrichose areas. Scutellum disk entirely white; apical dark area divided by pale lines. Anepisternum dorsal half pale; with one seta. Anatergite without a bright silvery spot.

Wing: Pattern distinct. Subbasal and discal crossbands clearly separated anterior to anal lobe, and cell c extensively hyaline; discal crossband distally aligned with a point beyond pterostigma and R-M crossvein within discal crossband. Subapical crossband joined to discal crossband. Posterior apical crossband reduced to a short spur. Anal lobe largely to entirely dark (sometimes with diffused paler areas). No bulla.

Legs: Femora dark.

Abdomen: With a distinct grey/silvery microtrichose band on tergite IV.

Female

Terminalia: Aculeus (not dissected but tip exposed) pointed.

(description after White et al., 2003)
