

***Trirhithrum demeyeri* White & Hancock.**

*Trirhithrum demeyeri* White & Hancock, 2003: 93.

Wing length=5.4-7.0 mm; Aculeus length=2.14 mm.

**Male**

Head: Arista long pubescent to plumose. Three pairs frontal setae. Face variable from dark to pale.

Thorax: Postpronotal lobe entirely dark. Scutum without silvery-white microtrichose areas. Scutellum disk white; margin dark between setae. Anepisternum entirely dark; two setae. Anatergite without a bright silvery spot.

Wing: Pattern distinct. Subbasal and discal crossbands fused throughout; cell c largely dark. Discal crossband distally aligned with a point basal to pterostigma; R-M crossvein well distal to edge of discal crossband. Subapical crossband joined to discal crossband; base deep, partly in cell dm. Posterior apical crossband reduced to a short spur. Anal lobe largely to entirely dark. No bulla.

Legs: Femora dark.

Abdomen: With distinct grey/silvery microtrichose spots/bands on tergite IV.

**Female**

Terminalia: Aculeus long and bluntly pointed; spermatheca curved and bulbous apically (the apical papilla may be a variable feature).

(description after White et al., 2003)
