

***Trirhithrum micans* Munro**

Trirhithrum micans Munro, 1957: 872

Wing length=4.5-5.1 mm.

Male

Head: Arista long plumose. Two pairs frontal setae. Face white.

Thorax: Postpronotal lobe pale with a dark central mark. Scutum without silvery-white microtrichose areas. Scutellum disk dark; margin with baso-lateral pale spots; spots adjacent to bases of apical setae. Anepisternum largely dark; dorsal edge narrowly pale; one seta. Anatergite (best viewed from behind) with a bright silvery spot.

Wing: Pattern distinct. Subbasal and discal crossbands fused posterior to Rs and cell c extensively hyaline; discal crossband distally aligned with a point near apex of pterostigma and R-M crossvein within discal crossband. Subapical crossband not joined to discal crossband. Posterior apical crossband reduced to a short spur. Anal lobe partly coloured, with a hyaline indentation (ending before vein A_1+Cu_2) and broadly hyaline margin. No bulla. Legs: Femora dark.

Abdomen: With distinct grey microtrichose stripes.

Female

Terminalia: Aculeus pointed (not dissected but apex exposed in paratype).

(description after White et al., 2003)
