

***Trirhithrum resplendens* Hancock**

Trirhithrum resplendens Hancock, 1984: 298

Wing length=4.0-5.0 mm.

Male

Head: Arista micropubescent. Two pairs frontal setae. Face white.

Thorax: Postpronotal lobe entirely dark. Scutum without silvery-white microtrichose areas. Scutellum disk dark; margin without baso-lateral pale spots; no spots adjacent to bases of apical setae.

Anepisternum pale in dorsal third; pale area narrowing anteriorly; one seta. Anatergite without a bright silvery spot.

Wing: Pattern distinct. Subbasal and discal crossbands fused posterior to Rs and cell c extensively hyaline; discal crossband distally aligned with apex of pterostigma; R-M crossvein usually well distal to edge of discal crossband. Subapical crossband joined to discal crossband; base deep, partly in cell dm. Posterior apical crossband complete, extending from vein C to wing margin. Anal lobe largely hyaline. No bulla.

Legs: Femora dark.

Abdomen: With distinct grey/silvery microtrichose bands on terga II and IV.

Female

Unknown.

(description after White et al., 2003)
